OBJECTIVE

Seeking a Software Engineering role with a focus on backend development and DevOps, where I can leverage my experience in cloud infrastructure, CI/CD pipelines, and scalable microservices to build reliable, high-performance systems.

HIGHLIGHTS OF QUALIFICATIONS

- 3+ years of experience developing and deploying scalable backend systems in cloud environments.
- Hands on experience with CI/CD pipelines, containerization, and cloud infrastructure (AWS, Azure, Docker, Kubernetes)
- Strong background in microservice architecture and distributed systems.
- Experience building and maintaining data pipelines and real-time streaming systems.
- Proven ability to improve system reliability through logging, monitoring, and debugging tools.
- Skilled in automating workflows and optimizing deployment processes.
- Comfortable working across the stack, including backend services and frontend systems.

TECHNICAL SKILLS

- **Languages:** Go, Python, Java, C, C++
- **Web:** HTML, CSS, JavaScript, TypeScript
- **Cloud and DevOps:** AWS, Docker, Kubernetes, CI/CD (CircleCI), Logging and Monitoring (Mezmo)
- **Databases:** PostgreSQL, MySQL, Redis, NoSQL
- **Tools:** Confluence, Jira, Git, Slack, Microsoft 365 Enterprise, Windows OS, Windows Server, Linux

EDUCATION

Cloud Computing Technologies, Graduate Certificate **2026**
George Brown Polytechnic, Toronto, ON

- Positioned to receive certificates in both Microsoft Azure and AWS in the second semester after taking 3 courses each on both subjects
- Received hands on experience with network technologies, Windows Server, and Microsoft 365 Enterprise administration services.
- Showed initiative and leadership in group settings by guiding multiple teams towards their goal in lab settings when assistance was requested.

Computer Engineering, Bachelor of Applied Science **2016 – 2022**
Queen's University, Kingston, ON

- Worked alongside other students as a member of the Queen's Vertical Farming Team (QVFT) as the lead Control Systems and Software Engineer.
  - Helped design an automated feedback control system to maintain optimal plant growth conditions using sensors, actuators, and microcontrollers.
  - Built circuits to collect data from pH, temperature, humidity, pressure, EC, and load cell sensors and control pumps and valves.
  - Wrote the microcontroller software to automate the system hardware, as well as setting up real-time data uploads to a SQL database.
- Co-developed software as a capstone project that used machine vision and neural networks to predict optimal grasping points for a robotic arm based on object size and shape, using Python libraries including OpenCV, Keras, and TensorFlow.

PROFESSIONAL EXPERIENCE

Associate Software Engineer III (Contract) **Aug 2024 – Nov 2024**
GameSheet Inc, Remote, Newmarket, ON

- Designed and implemented robust microservices in Go using the Fiber framework, enabling efficient REST API operations for POST, GET, and DELETE requests in the Main database while integrating an Events database to capture requests for auditing, analytics, and future scaling.
- Programmed, debugged, and maintained two flagship frontend platforms – the Admin Dashboard and the Team App – both developed in TypeScript. Delivered new features and resolved critical bugs to enhance performance, usability, and seamless user interaction.

Software Engineer **Aug 2022 – May 2024**
DMG Blockchain Solutions Inc, Remote, Delta, BC

- Spearheaded the development of a microservice in Go, processing data from 8000+ Bitcoin miners streamed from Apache Pulsar topics and efficiently inserting relevant information into appropriate PostgreSQL database tables.
- Collaborated closely with a cross-functional team to troubleshoot visual bugs and database procedure errors on a dynamic mining pool dashboard.
- Implemented and maintained CI/CD pipelines using CircleCI, enhancing development efficiency and deployment reliability.
- Integrated logging and alerting features with LogDNA / Mezmo to ensure robust monitoring and quick response to issues.
- Demonstrated strong autonomy by successfully translating previous projects from Python to Go, optimizing performance and maintainability for future scalability.
